

Decision Log

Project: AI Ticket Intake
Author: Christina

Top three product decisions

1. Clickable guidance + AI Q&A

For AI ticket intake, I care most about **saving time and improving efficiency**. I want prompts and guidance to **connect and be clickable**, so users are not stuck starting from a blank box—**click and move forward**. I am also committed to **AI Q&A**, because many people **cannot explain the issue in one sentence** and do not know what to fill in; asking step by step is closer to real problems than staring at empty fields.

2. Web demo first; chat / email / portal later

I know intake in the real world spans **chat, email, portal**, and more. This time I want to focus effort on **the AI itself**: a Web demo is **clear at a glance** for a v1.

3. Add AI phone / voice

Speech input is accurate enough now, and many products are trying **voice-driven flows**—I want that in this system too. **Some people prefer speaking to type information**, especially when reporting incidents in a hurry.

Key trade-offs

- **Guidance + Q&A**: more time researching recurring errors and real usage, but users spend less effort thinking and get more convenience.
- **On AI voice calls I could have the AI read back output directly, but I changed it to let customers edit**: in practice that gave people a sense of control and improved accuracy.
- **Voice / phone**: some customers worry about privacy; for people not always in noisy environments, many prefer speaking to typing. **In the AI era, reading beats listening for taking in information, but speaking beats typing for putting information in.**

What I will test with real users first

Compare **clickable guidance + AI Q&A** with **plain forms**: which yields more complete tickets, faster submission, and fewer mid-flow drop-offs.

Then see whether **voice / phone** gets real use in a real office or stays unused, and whether people accept **AI suggestions with a final human click to confirm**.
