

Go-To-Market Plan: AI Ticket Intake

Product: AI Ticket Intake

Author: Christina

Date: April 2026

1. Target Initial Customer Segment

Primary target: Mid-size MSPs (10–50 staff) already using MSPbots AI Ticket Triage.

Rationale:

- They already trust MSPbots' AI capabilities and are familiar with the credit-based pricing model.
- They experience the intake quality problem at scale — high ticket volume makes incomplete tickets a measurable cost.
- They have dedicated dispatchers who can quantify time savings immediately.
- Shortest path to value: AI Intake feeds directly into AI Triage, creating a visible quality improvement in an existing workflow.

Secondary target: Small MSPs (1–10 staff) using MSPbots BI dashboards but not yet on AI Triage.

Rationale:

- AI Intake can serve as the entry point into MSPbots' AI product suite — a "land" product that leads to Triage and QA adoption.
- Small MSPs benefit from AI Intake because they lack dedicated dispatchers; AI compensates for the missing role.

2. Rollout Strategy

*Timeline note: week ranges below (e.g., Weeks 1–4) are an **illustrative ideal schedule** for sequencing only. **Actual dates must be set based on team capacity** (engineering, QA,*

customer-facing, marketing) and dependencies; phases may slip, overlap, or include buffer time.

Phase 1: Closed Beta (illustrative: Weeks 1–4)

Element	Detail
Size	10 MSPs (8 mid-size, 2 small)
Selection criteria	Active AI Triage users, >500 tickets/month; each MSP names a weekly contact who can join short feedback calls
Scope	Portal intake only (email intake added in Phase 2)
Pricing	Free during beta; AI Intake actions consume existing credits at no additional cost
Support	Dedicated Slack channel with Product team; weekly 15-min feedback calls
Success gate	>60% weekly active usage, >60% suggestion acceptance rate, qualitative positive feedback from dispatchers

Phase 2: Expanded Beta + Email Intake (illustrative: Weeks 5–8)

Element	Detail
Size	Expand to 30 MSPs; add email intake for original 10
Scope	Portal + Email intake
Pricing	Introduce credit consumption: 1 credit per AI Intake action (same pool as Triage)
Validation	Measure ticket completeness improvement, coordinator time reduction, credit consumption patterns
Success gate	Completeness rate >80%, coordinator time <1 min for AI-assisted tickets, NPS >40 among beta users

Phase 3: General Availability (illustrative: Weeks 9–12)

Element	Detail
Audience	All MSPbots customers (AI Triage users first, then broader base)

Element	Detail
Activation	One-click enable from MSPbots dashboard; 10-minute setup (field mapping auto-detected from the customer's connected ticketing setup)
Pricing	AI Intake credits bundled into existing subscription tiers; marketed as "AI Ticket Suite" alongside Triage
Launch motion	Product announcement email, in-app banner, webinar demo, case study from beta MSP

Rollout Timeline

Same caveat as above: week labels are illustrative; the project calendar governs.

3. Adoption Triggers & Messaging

Trigger 1: In-Product Data Insight

Surface a metric in existing MSPbots BI dashboards:

"X% of your tickets last month were missing required fields. AI Intake could have caught them."

This creates awareness from real data, not marketing claims. The MSP sees their own problem quantified.

Trigger 2: Triage Accuracy Correlation

For AI Triage users, show:

"Tickets with complete information are triaged 40% more accurately. Improve intake quality with AI Ticket Intake."

This links the new product to a metric they already care about.

Trigger 3: Time-Saved Messaging for Dispatchers

Direct messaging to service coordinators:

"Stop spending 3–10 minutes per ticket chasing context. AI Intake collects the right information before the ticket reaches you."

Key Messaging by Audience

Audience	Core Message
MSP Owner / Manager	"Reduce operational cost per ticket and improve service margins"
Service Coordinator	"Tickets arrive complete — no more back-and-forth for basic details"
Technicians	"Start troubleshooting immediately — every ticket has context from the start"
End Users (MSP clients)	"Get faster help by describing your issue once — AI handles the rest"

4. Success Criteria for Phase 1 (Closed Beta)

These metrics support pilot review and the decision to widen rollout. Definitions—especially what counts as the coordinator’s **first meaningful action**—should be agreed **in writing** with the **customer-facing team** before kickoff.

Except **NPS** (survey), beta metrics below are intended to be computed from **API-sourced data**: ticket/session payloads pulled via API or structured events posted to an API and stored—then aggregated in reporting or a warehouse. Field and event names should be aligned with Engineering before pilot kickoff.

Metric	Target	Measurement
Portal Intake coverage (weekly)	> 60% of weekly Portal tickets that should use Intake have a server-side Intake submitted/completed record (definition matches PRD)	Via API , pull ticket records (source, Intake status, etc.), aggregate by calendar week, compute numerator/denominator
AI suggestion acceptance rate	> 60%	Per-suggestion outcomes (accept / accept-after-edit / reject) posted via API or persisted by the intake session service ; compute rate in analytics
Ticket completeness improvement	+30% vs. pre-beta baseline	Via API , snapshot ticket fields and score completeness against required-field rules (customer config + PRD)
Coordinator time per ticket	Measurable reduction (target: <2 min)	Via API , read agreed timestamp fields on the ticket (e.g., created vs. first meaningful coordinator action); definitions agreed in writing with the customer-facing team before beta
Net Promoter Score (beta users)	>40	Short post-beta survey
Intake flow abandonment	If users drop off mid-flow while describing the issue at a materially high rate (set a baseline in week 1 of beta, then a red-line threshold or “worse week-over-week” trigger), run root-cause tracking : which step, errors, copy/length, friction; sample follow-ups by the customer-facing team if needed	Funnel from step events stored via API ; optional exit reason in the same pipeline

How this row “passes”: below the red line **or**, if the line is crossed, root-cause tracking plus a concrete remediation plan is completed within an agreed window (so the metric is about **visibility + action**, not pretending churn never happens).

Go / No-Go Criteria

GO if: ≥ 4 of 6 metrics hit target, and no critical usability or accuracy issues reported.

ITERATE if: 2–3 metrics hit target; analyze gaps, adjust prompts/UX, extend beta by 2 weeks.

NO-GO if: < 2 metrics hit target or critical trust/accuracy issue surfaces; pivot approach before further investment.

5. Launch Support Plan

Activity	Timing	Owner
Beta recruitment outreach	Week 0	Customer-facing team
Customer onboarding guide (configuration + usage; no on-prem install)	Week 0–1	Product
Weekly beta feedback calls	Week 1–4	Product + customer-facing team
In-app tooltip and guided tour	GA launch	Product + Engineering
Product announcement email to all customers	GA launch	Marketing
Webinar: "AI Ticket Suite — From Intake to Triage"	GA launch week	Marketing + Product
Beta customer case study (publishable story: how a pilot MSP used Intake; for web, events, or sales talk track, with customer approval)	GA +2 weeks	Marketing + customer-facing team
Sales demo kit: demo flow + talk track	GA launch	Product + Sales
